

Power Automate for leaders

Strategic Automation Leadership

Batch 1 09:00–16:00

Your end-of-day outputs

Use available pre-survey findings

No findings? Use the fictional case

Power Automate in everyday work

Power Automate runs configured workflow steps

A kitchen analogy

**With a clear recipe,
which tasks can repeat?**

Who checks an allergy exception?

People check exceptions

Routine steps follow rules.
A responsible person checks exceptions.

Common workflow tasks

01

Route requests

To the responsible person

02

Send notifications

Under agreed rules

03

Update records

Through supported services

Rules and human judgement

Systems follow rules

Route information

Notify and follow up

People use judgement

Make business decisions

Check results and own outcomes

Information, permissions, and connections must be ready

The fictional training request

The coordinator checks missing details; the manager owns the business decision.

The flipchart before-and-after canvas

Current repeated step	System could support
Human decision	Check before trial

Expected benefit: _____

Scenario prompts A–C

- A** A request arrives in the approved mailbox. Notify the coordinator.
-
- B** A request does not match an agreed rule. A manager must decide whether it is suitable.
-
- C** The date is blank. The agreed rule says to ask the requester for it.

Unknown rule, access, or owner: More information needed
Judgement or approval: Human decision needed
Clear rule and access: System can help

Scenario prompts D–F

D Copy data from another system. Access has not been confirmed.

E At the agreed time, remind the agreed person about a waiting request.

F The manager has not decided. Tell the requester it is approved.

Unknown rule, access, or owner: More information needed

Judgement or approval: Human decision needed

Clear rule and access: System can help

Questions from the groups

- 01** What could the system support?
- 02** Which rule or detail remains unclear?
- 03** What must the process owner or IT confirm?

Block 1 checkpoint

Systems support repeatable rules

People retain accountability

After the break: test your understanding

Knowledge check

- 01** Routine copying or undefined exceptions?
- 02** Do reminders alone remove a delay?
- 03** What must be checked before connecting a system?

Known facts and open questions

Known fact	Open question	Verification owner

Use the A4 sheet. Agree one supported fact and one owned question.

MODULE 2

Unlocking Operational Bottlenecks

Map the work before choosing a change

Where requests wait

Awaiting a decision

Missing details

Evidence locates the problem before we choose a solution

Current-process map

Map 5–8 steps. Show the role and information or status at every handover.

Four types of friction

Repeated work

Enter the same information again

Missing details

The next step cannot start

Waiting

Work pauses during a handover

Unclear owner

Nobody takes responsibility

Three pain points to compare

Each pain point must link to a place on the map

Block 2 checkpoint

One current-process map

Three evidence-linked pain points

After lunch: select one opportunity

Opportunity readiness gate

Proceed to compare

No stop condition identified

Explore after validation

A responsible role must
validate a gap

**Do not progress in this
workshop**

Stop condition remains

Stop: sensitive data · material harm · unstable rules · frequent unowned exceptions · missing owner

Compare eligible opportunities

Impact	1	2	3	Which outcome is affected?
Frequency	1	2	3	How often does it happen?
Readiness	1	2	3	Are scope, rules, information, and owner clear?
Effort	Low	Medium	High	Low / Medium / High

A manageable boundary

Owner: who is responsible?

Outside scope: what is excluded?

Peer scope review

Explain for 2 minutes, discuss for 2 minutes, then swap

The selected bottleneck

One selected opportunity

Evidence-based reason

Boundary and owner

Use the same opportunity to design the Blueprint

MODULE 3

Strategic Workflow Blueprinting

Steps, decisions, and exceptions

Triggers, Actions, and connectors

Connector exposes service operations

Verify connections, permissions, information, and supported behaviour before real use.

Conditions and human decisions

Workflow Blueprint anatomy

Both decisions reach an explicit outcome; every exception route has an owner.

Flow cards: the physical draft

Use only cards that explain the selected opportunity

Block 3 checkpoint

One selected opportunity

A visible Trigger-to-outcome path

After the break: redraw the idea freely

The free-form flow map

Use the cards as inspiration. Exact Power Automate names are optional.

A safe workflow photo

SAFE MAP ONLY

No names, faces, badges, confidential details, or
unrelated flipcharts

Generative AI as a second reader

Second reader

People choose what fits

No readiness certification

Photo review and human revision

If the tool cannot read a label, clarify it. Do not let the tool invent missing information.

Leadership Handover Card

Improved map

Useful feedback

Changes made

Questions to confirm

Leadership Handover Card

Owner and expected benefit

Measure and support needs

Next decision and follow-up

Generative AI feedback is input, not evidence of readiness.

Three presentation points

- 01** **Problem and expected benefit**
- 02** How the flow works and where people remain responsible
- 03** Next decision, owner, and most important open question

Six group presentations

6 × 5 minutes

3 min Present

2 min Feedback

GROUP ORDER
